MarketView®

DESIGN. DEVELOP. DEPLOY.

Used independently or simultaneously, GlobalView API's and Data Services provide a highly effective and comprehensive solution to meet your needs.

MarketView XML API

Our GlobalView XML API provides a powerful application programming interface (API) that creates new possibilities for accessing commodity market information and integrating it into your internal systems. Designed as an XML web service, it uses open standards and transport protocols to exchange data and integrate applications. The XML API allows you to retrieve real-time, intraday and historical datasets and import proprietary data and news.

MarketView .NET API

Our GlobalView .NET API allows developers to connect to retrieve market data in just a few lines of code. The .NET API is based on LINQ so getting data from us is as easy as getting data out of a database. It supports both snapshot and streaming data, so it should fit your needs no matter whether you want to do a batch download, track real-time prices, or create your own GUI.

All .NET languages are supported including C#, VB .NET, Managed C++, F# , IronRuby and we support data binding out of the box. The .NET API comes complete with example source code for a quote board and a time series window, both done in ten lines of code. You can subscribe to quotes, time series data and news for the entire GlobalView symbol universe.

MarketView Data Extract

Data Extract is an automated service that provides a convenient and reliable source for accessing all of GlobalView's data delivered in a consistent format. Select the pricing data you need, the format you need it in, and the time you want it delivered. The application extracts the specified symbol code information from GlobalView's servers and delivers the data to you in a structured file via FTP. All Data Extract scheduled runs are analyzed and monitored by GlobalView's Data Services team. Our e-mail reporting system allows for customers to be automatically notified when the files are completed and made available.

MarketView Excel Tools

Deliver real-time, historical, and proprietary data directly into your Microsoft® Excel spreadsheets. Features include an intuitive symbol search for quick access to market data, access to user defined formulas, chart wizard and automatic unit and currency conversions. Excel Tools works independently from the MarketView desktop application and is easily implemented via an add-in to your Excel spreadsheet application. Data is accessed over the Internet and is protected by a user ID and password combination.
